Precipitation and wind gusts during Storm Kyrill

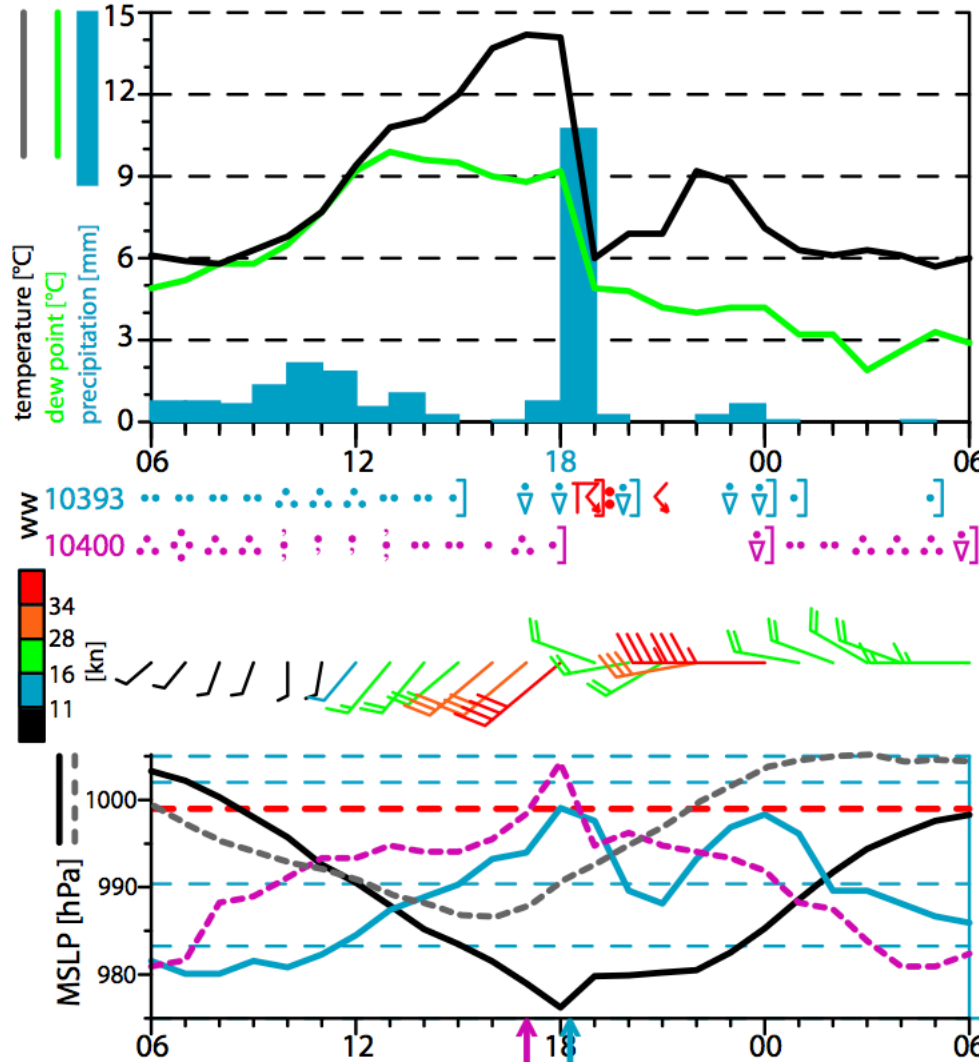

Maximum wind gusts

18:30 UTC 18 January radar reflectivity
24-h precipitation accumulation (numbers)

Precipitation and wind gusts during Storm Kyrill

Lindenberg

Lindenberg (blue)
Düsseldorf (magenta)

Aim

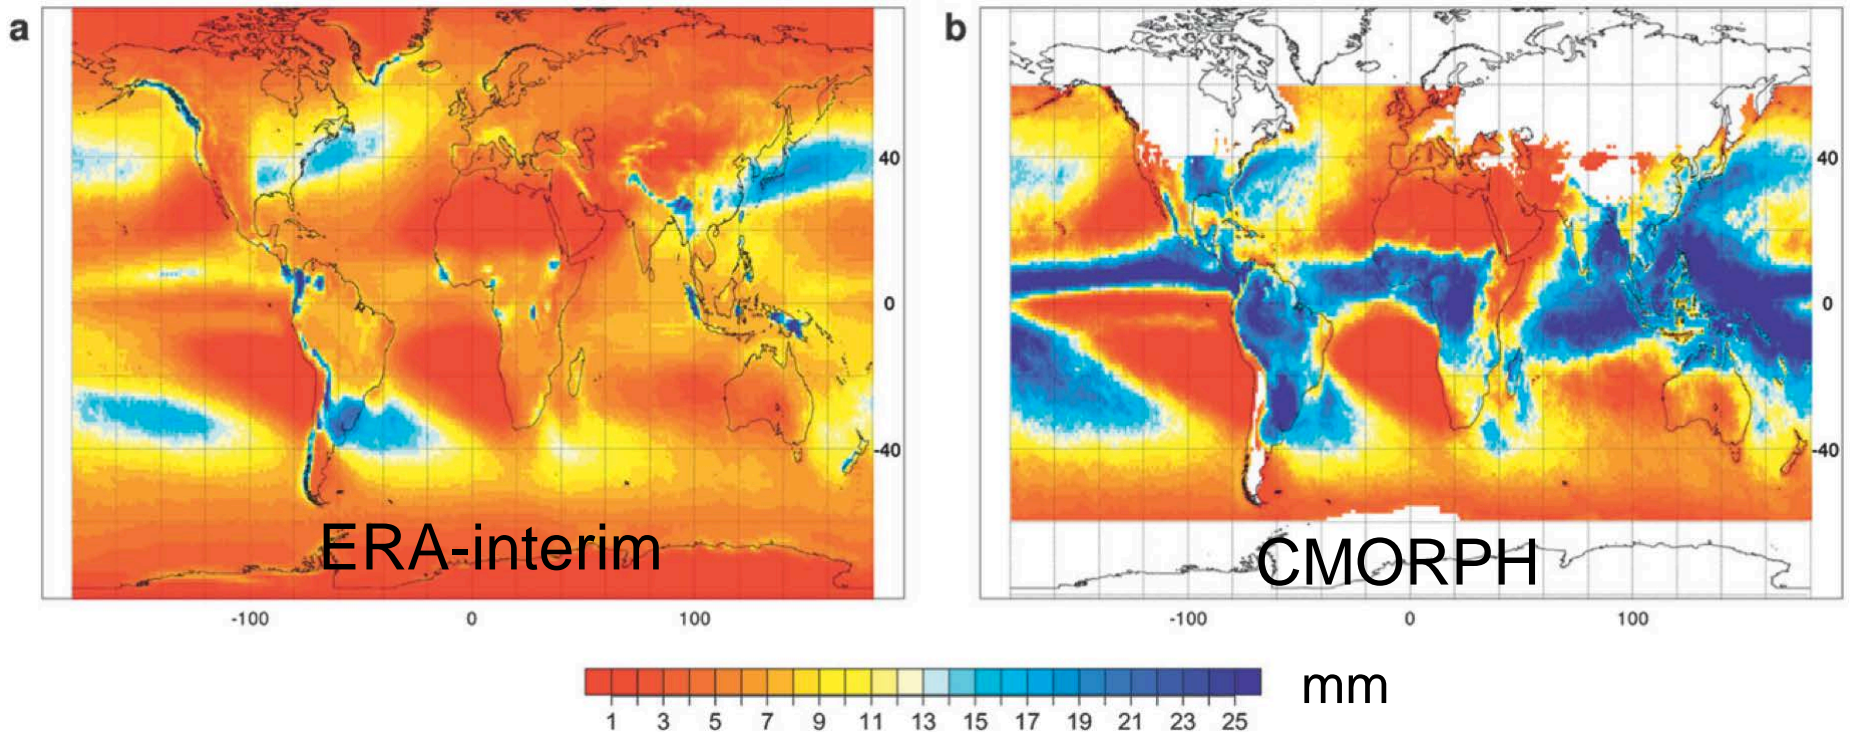

- > Climatological analysis and quantification of the joint occurrence of daily precipitation and wind extremes using Era-Interim

Data

- > ERA-interim daily precipitation and wind extremes (1979 – 2013) interpolated to a 1° by 1° grid
- > Seasonal 98th percentiles
- > Converted to binary (extreme = 1 / non-extreme=0) time series per grid point → input for logistic regression

Precipitation extremes

99th percentile of 6 hourly precipitation

Statistical approach

- > Logistic regression model:

$$\text{logit}(p(t)) = b_0 + b_1 \text{Gust}(t)$$

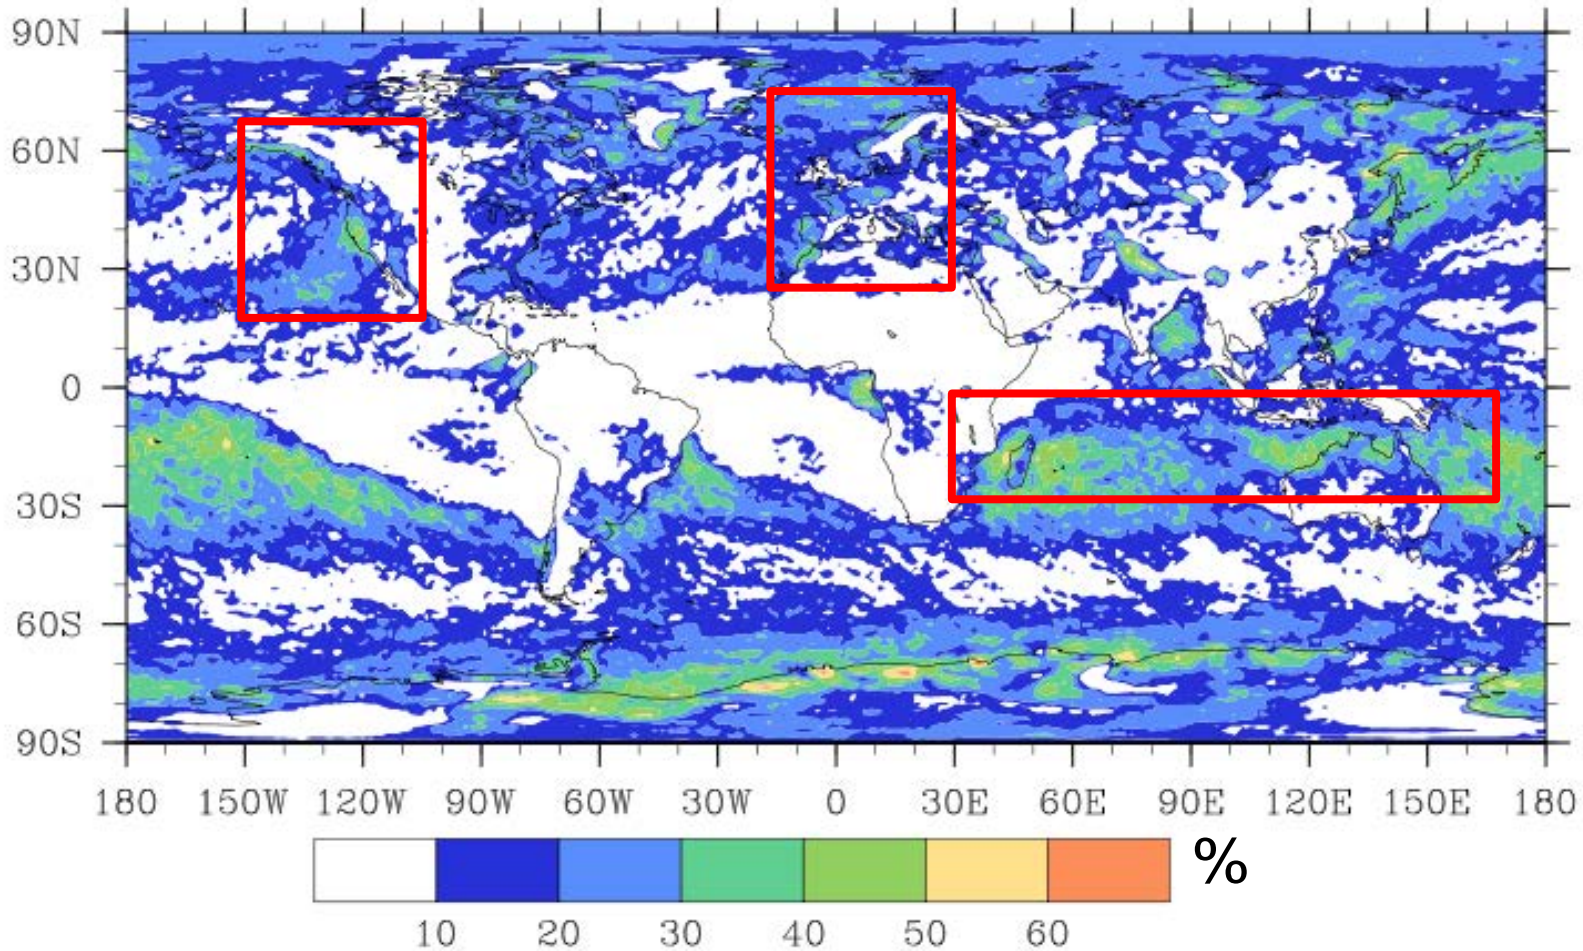

$$\text{logit}(p(t)) := \log \frac{p(t)}{(1 - p(t))}$$

$$p(t) := P(\text{precip}(t) = 1 \mid \text{Gust}(t))$$

- > $p(t)$ is the probability of observing an extreme precipitation event at time t given the wind gust at time t
- > The odds ratio $\exp(b_1)$ is a multiplicative factor that increases or decreases the odds of an extreme precipitation event

Percentage of compound extremes

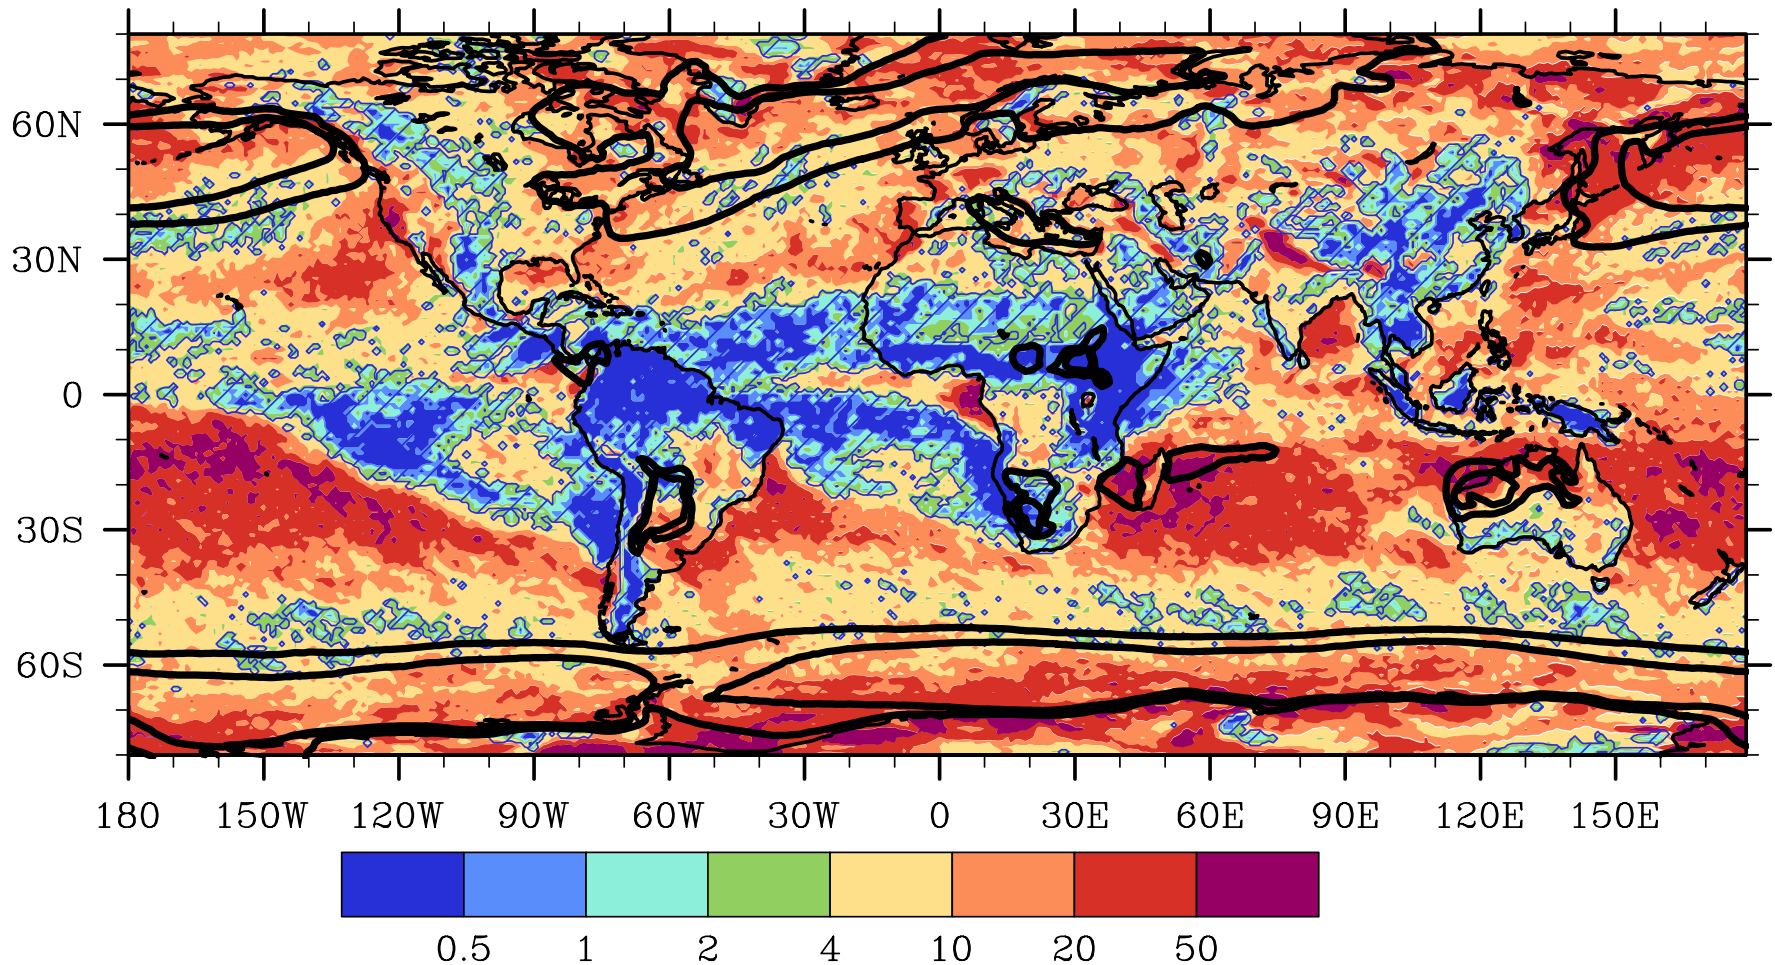

DJF

Significant association

b
xxxxxxxxx

DJF exp(b1)

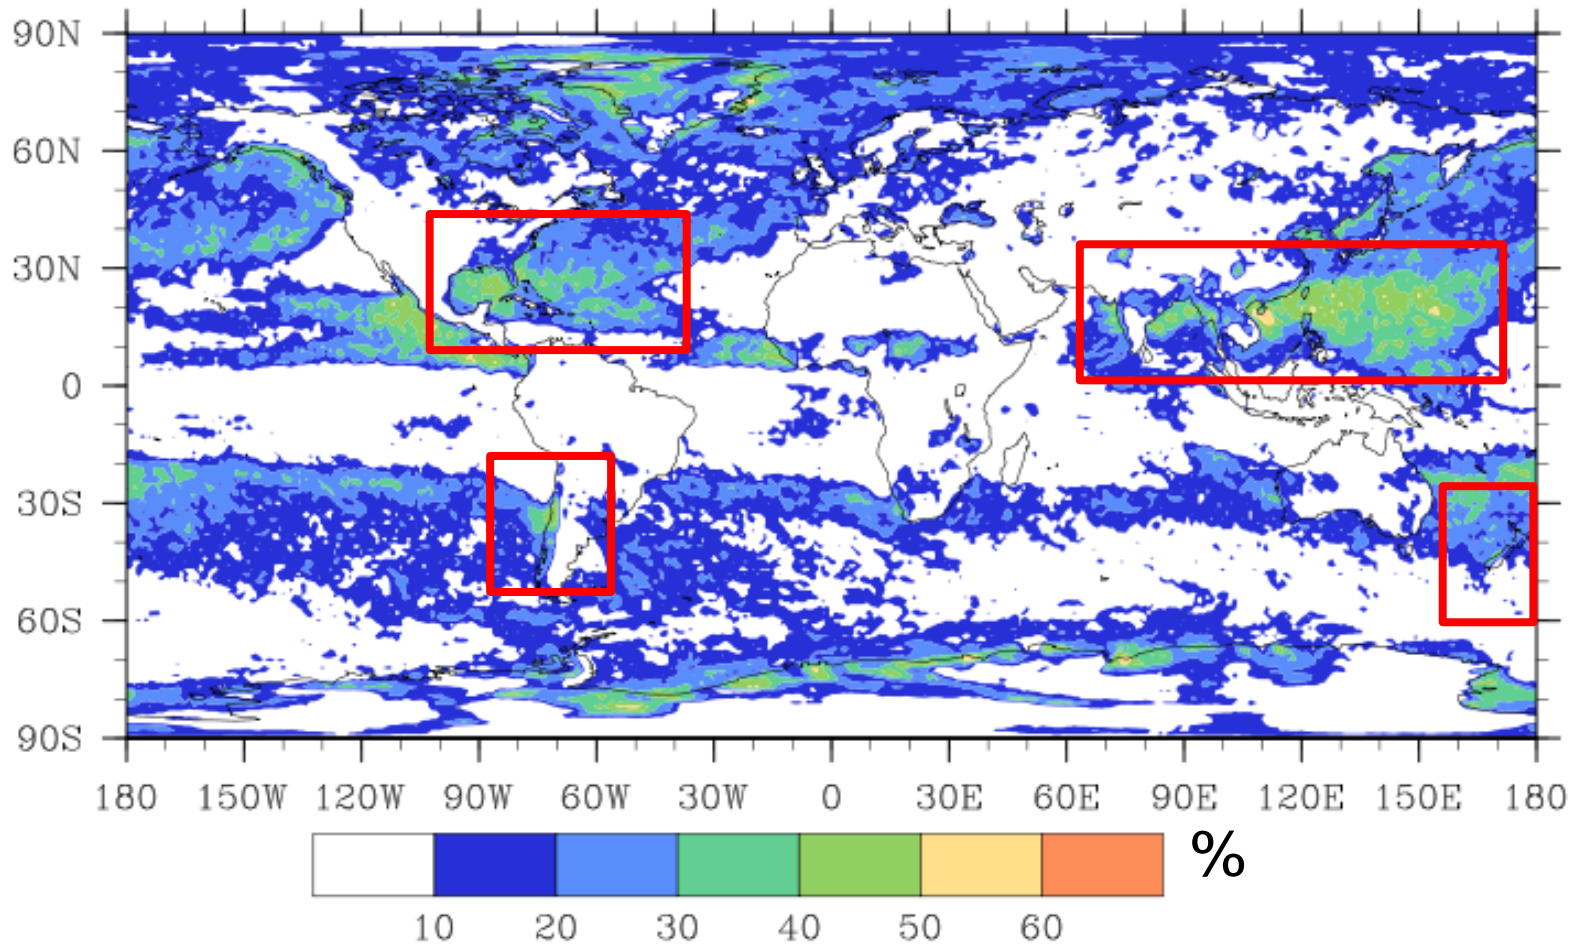

Black contours: cyclone frequency (Wernli and Schwierz 2006)

Hatched areas not significant

JJA exp(b1)

Black contours: cyclone frequency (Wernli and Schwierz 2006)

Hatched areas not significant

Joint occurrence of precipitation and wind extremes over Europe in winter

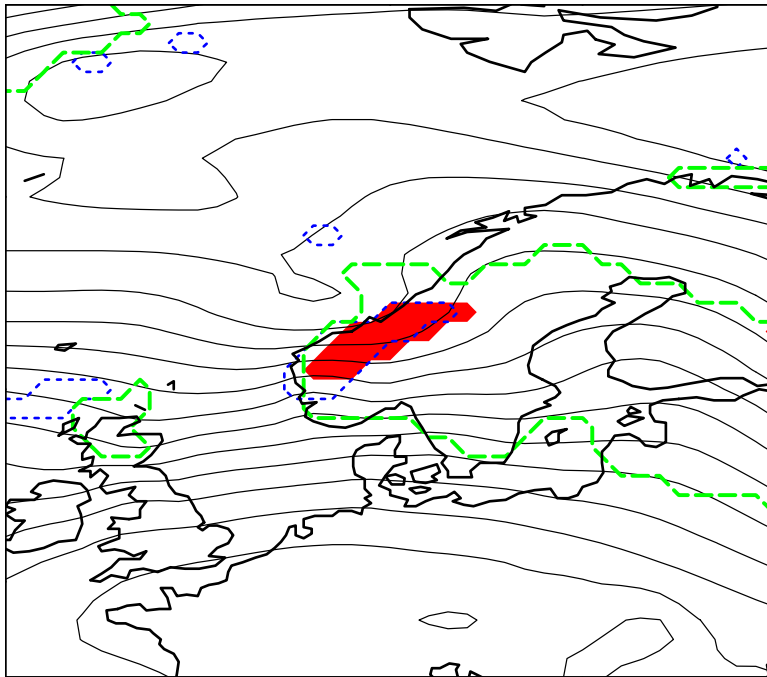

$$\text{logit}(p(t)) = b_0 + b_1 \text{Gust}(t)$$

Black contours: cyclone frequency
(Wernli and Schwierz 2006)

Hatched areas not significant

Storm Dagmar

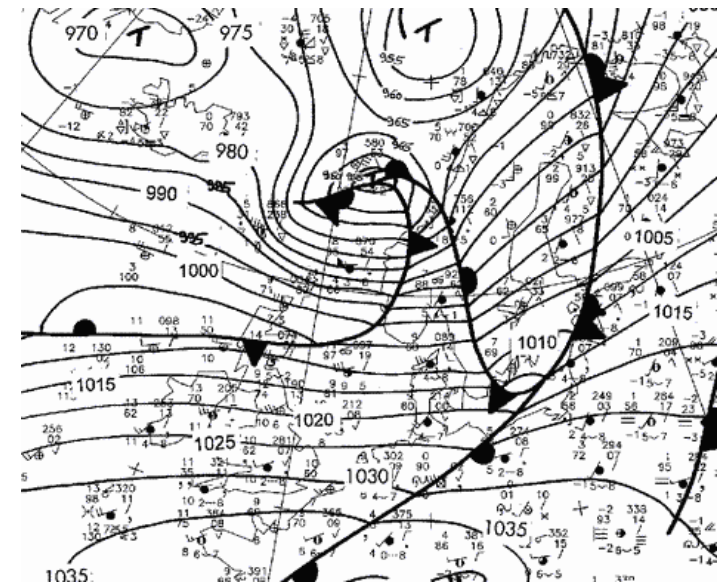

25 December 2011

Green line: wind extremes
Blue line: precipitation extremes
Red area: concurrent extremes

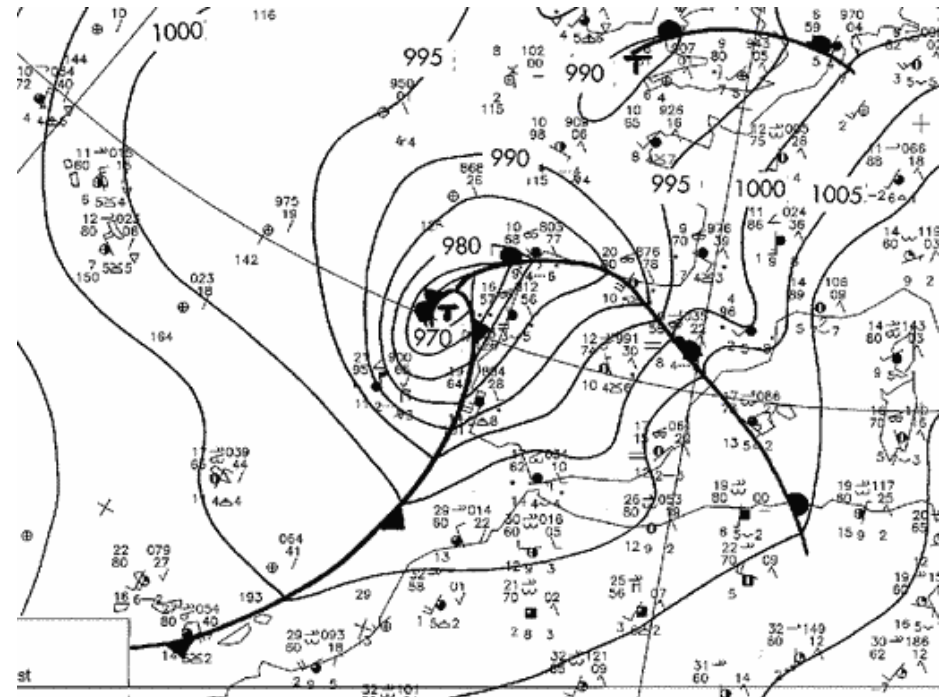

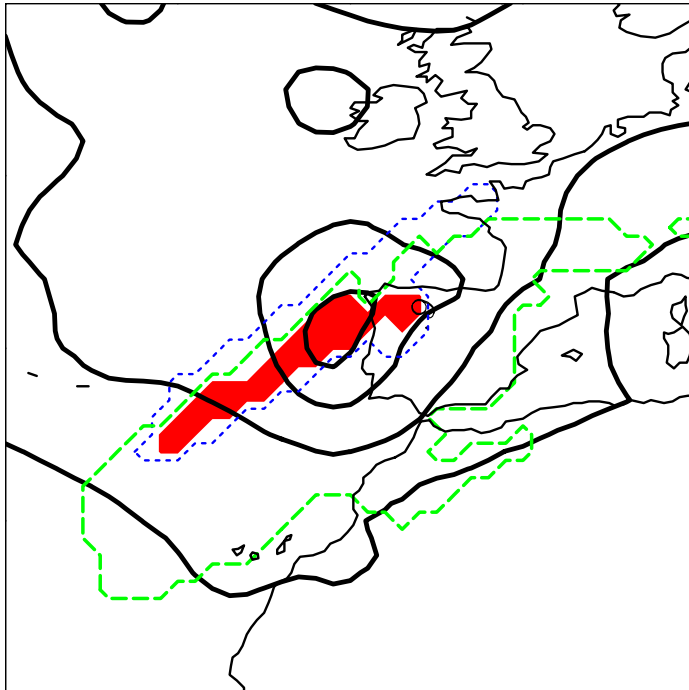

DWD surface analysis

Storm Xynthia

27 February 2010

DWD surface analysis

Green line: wind extremes
Blue line: precipitation extremes
Red area: concurrent extremes

Summary and conclusion

- > Statistically significant co-occurrence of wind and precipitation extremes
- > Absolute values:
 - DJF up to 35% along the west coast of Europe and up to 40% along the west coast of North America and along the west coast of Australia
 - JJA similar values along the west coast of New Zealand and South America and in the tropical cyclone areas
- > Strong spatial variability
- > Strong seasonal variability
