Number of hail days in June in northern Switzerland

of hail days in June

25

- > Strong interannual variability
- > Very short time period with hail observations (2002 – today)

Radar based observations

Aim

u^b

b
UNIVERSITÄT
BERN

UNIVERSITÄT BERN | Mobilis Lab
OESCHGER CENTRE | for Natural Risks

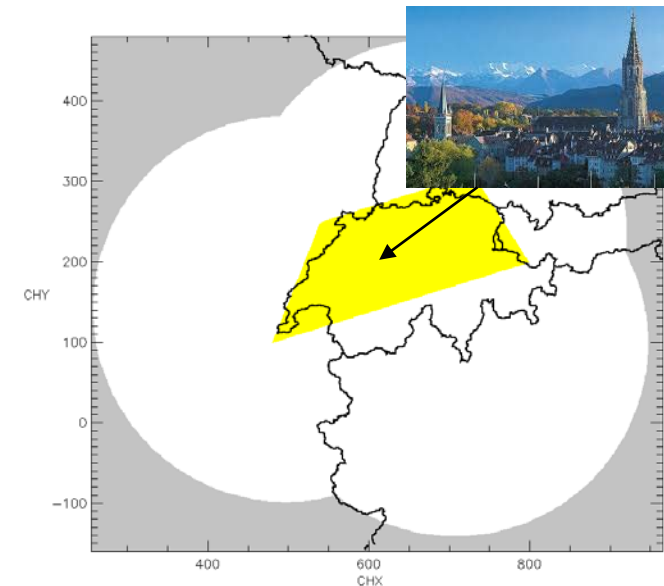

- > The aim is to capture the interannual variability using a simple statistical model and coarse-resolution reanalysis data

If we are successful

- > An extension of a hail time series back and forward in time beyond the observational record is possible
- > Insight into the driving processes can be gained

Data and Methods

- > Radar based hail observations
- > Hail days defined as days with POH > 80% over >100km² in northern Switzerland (Nisi et al. 2015)
- > Predictand: hail days per month
- > Predictors: from ERA-interim
- > Logistic and linear regression models
- > Monthly mean CAPE from the 20th century reanalysis data averaged over Central Europe

Predictor selection

- > Predictor environmental parameters based on literature
- > All monthly mean anomalies to the long term climatology
- > The seasonal cycle is included in the model as a separate variable (April to September)

Model selection

> Regression models:

1. Poisson model using all predictors
2. Poisson model without multicollinearities
3. Models with higher-order interactions (glmulti)
4. Two-part models (count part and zero part)
5. Linear model

Model comparison

No substantial differences between the models

Model selection and comparison

- > Regression models:
- > Poisson model without multicollinearities

best AIC
& other
measures

Final model:

$$\mu = e^{-0.75+0.136TEMP2M+0.248 \ln(CAPE)+0.032SHEAR+\beta_4 SEASON}$$

June 2006 – 12 hail days

In June 2006

- Positive SST anomaly east of Newfoundland
- Extratropical jet located further north
- Stronger anticyclone over central Europe

June 2004 – 4 hail days

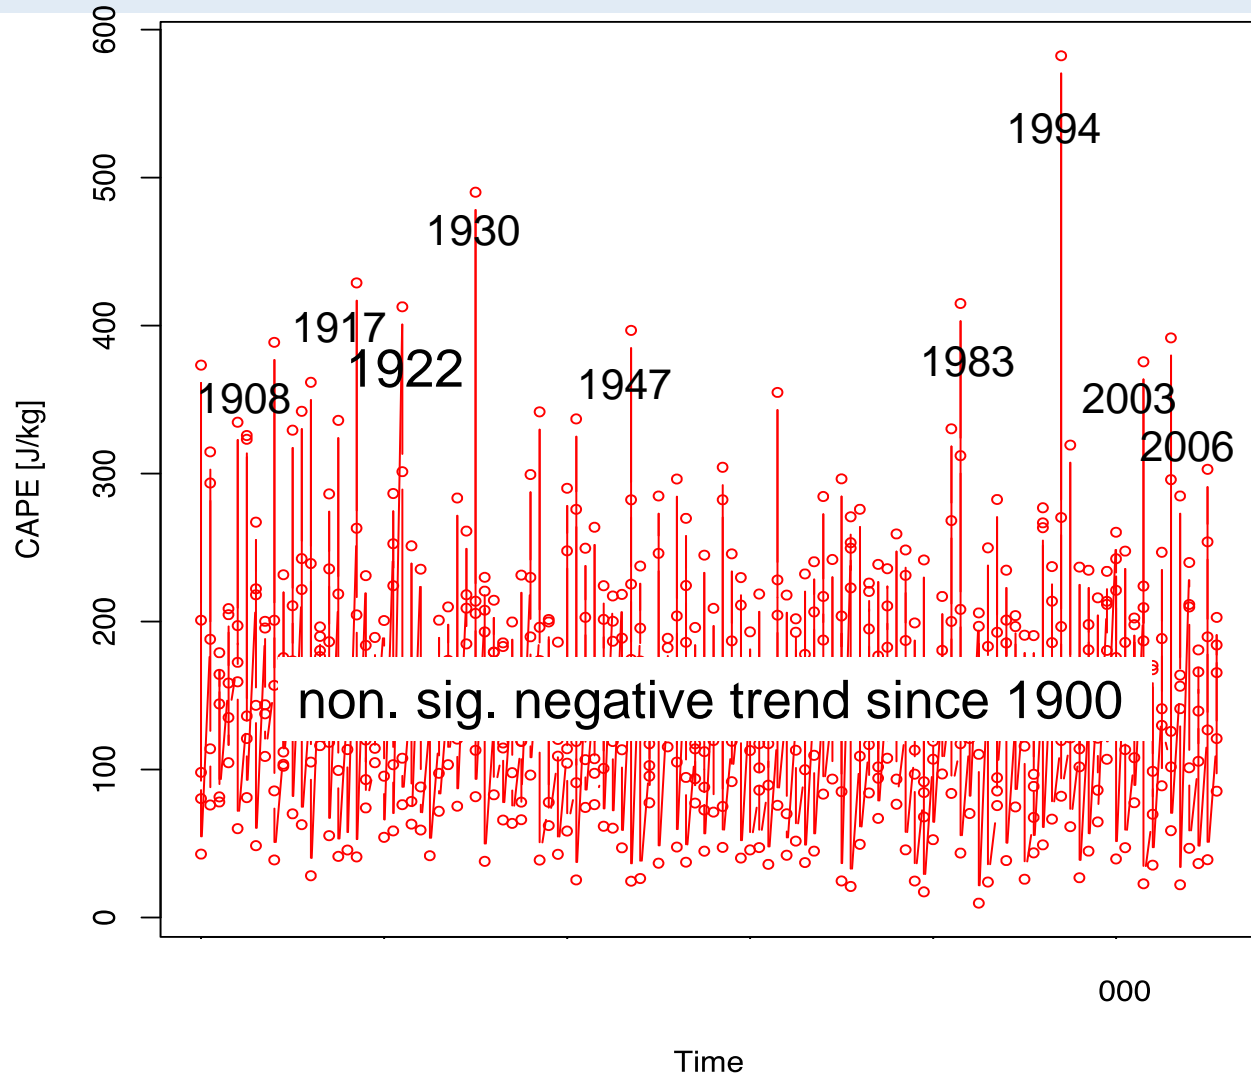

CAPE over central Europe in 20CR May through September

CAPE over Central Europe in May

Changes in seasonality?

Month	Trend	Significant
May	-	95 th
June	no	no
July	no	no
August	+	99 th

Summary

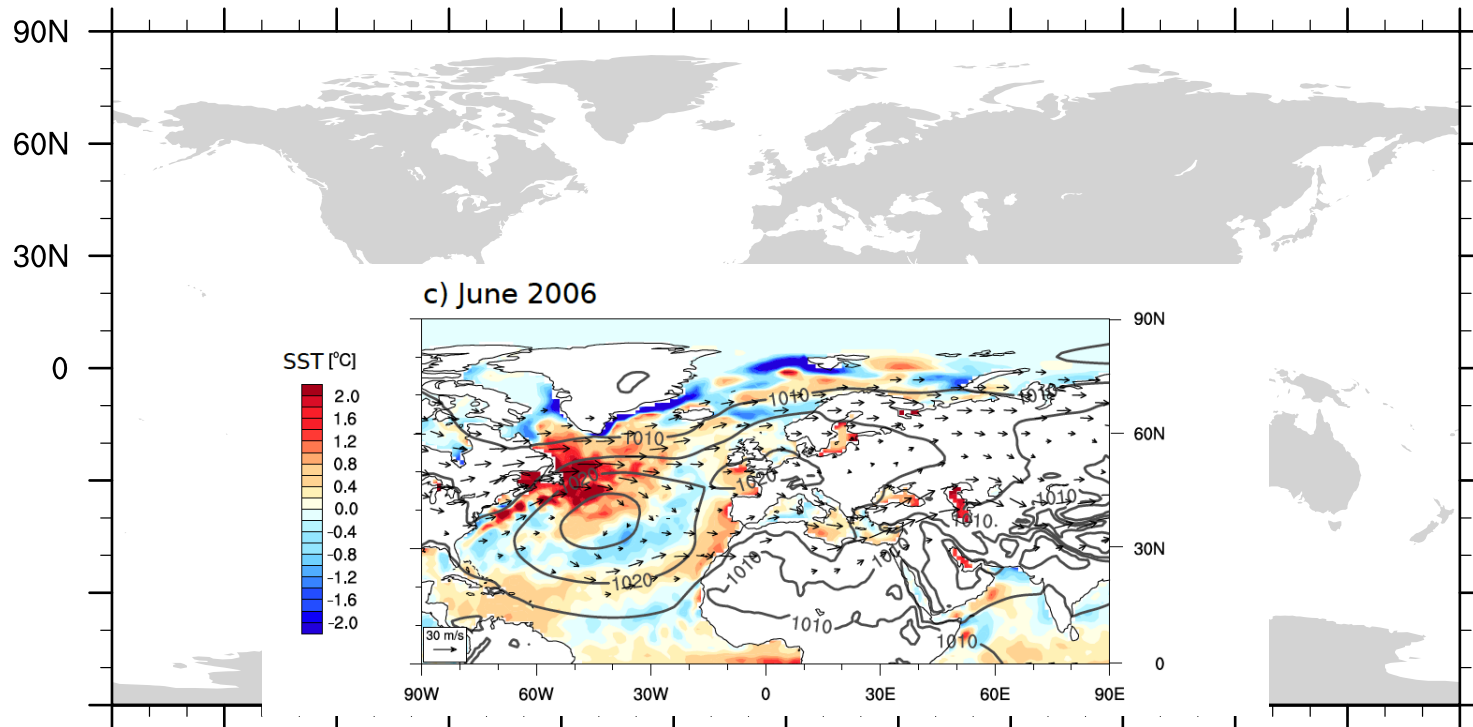

- > Strong year-to-year variability of hail in northern Switzerland
- > Monthly mean MLCAPE and two meter temperature are important predictors of the # of hail days per month in northern Switzerland
- > Strong decadal variability of CAPE in the 20th century
- > Seasonally varying trends
- > Next step:
 - Verification with CERA /ERA20C

Correlation June CAPE_{Europe} vs. T2M
